

The foundation is strong. The *leaks* are fixable.

A full technical and marketing review of all 19 live pages — code, performance, search visibility, and conversion. Nineteen findings, ranked by what actually moves bookings.

19 pages crawled

Aug 31, 2026

GitHub Pages · static HTML

GA4 G-JR53KRE033 active

Bottom line: You've already done the hard part — this is a hand-coded, schema-rich, genuinely well-built site, and it's miles past a GoDaddy builder. The problems aren't architectural. They're a handful of broken assets, an enormous amount of unoptimized image weight, and real social proof that's hidden where nobody sees it. Roughly **a weekend of work closes the highest-value gaps.**

SCORECARD

Where you stand

Measured directly against the live site — HTTP responses, asset weights, and rendered markup.

A-

CODE QUALITY

Clean semantic HTML, canonicals, working redirects, honeypot on forms.

A

STRUCTURED DATA

LocalBusiness, Service, FAQPage, Breadcrumb, Article. Better than most agencies ship.

F

PERFORMANCE

Portfolio page weighs ~105 MB fully loaded. This is the single biggest problem.

C+

CONVERSION

Great CTAs and pricing, but six 5★ reviews are buried two clicks deep.

B-

SEO

Strong fundamentals undercut by truncated tags and a 404 in your sitemap.

0 bytes

SOCIAL SHARE IMAGE

og-image.jpg is an empty file. Every shared link renders blank.

Four things actively costing you

Each of these is a confirmed defect on the live site, not a stylistic opinion.

Your Open Graph image is a 0-byte file

CRITICAL

15 MIN

`/images/og-image.jpg` returns HTTP 200 with **a content-length of zero**. Every page references it for both Open Graph and Twitter cards.

The practical effect: every time you or a client posts your link to Facebook, texts it to a couple, drops it in a Realtor Slack, or shares it on LinkedIn, it renders as a blank grey box. For a business whose entire product is visual, this is the worst possible first impression — and it's happening on every share, on every page.

FIX

Export a 1200×630 JPEG — a strong hero frame with the Orion logo and "Videography & Photography · Capital Region NY" — upload to `/images/og-image.jpg`, then re-scrape with Facebook's Sharing Debugger to clear the cached blank.

Your sitemap points Google at a 404

CRITICAL

1-3 HRS

`/real-estate/saratoga-springs-ny.html` is listed in `sitemap.xml` with priority 0.8 and is **linked from three of your blog posts** — but it returns 404. The page was planned and never shipped.

You're telling Google to crawl a page that doesn't exist and passing internal link equity into a dead end. Worse, you've lost the page itself: "real estate photography Saratoga Springs" is one of your five named target keywords in your own brand guide, and Saratoga is your highest-value market.

FIX

Build the page — don't just delete the link. A Saratoga Springs real-estate landing page with local venue and neighborhood references is exactly the kind of content that wins map-pack and long-tail traffic. Then replicate it for Albany, Troy, Clifton Park, and Schenectady.

The navigation breaks between 769px and ~1050px

CRITICAL

30 MIN

Your hamburger menu only activates at `max-width: 768px`. Above that, the full desktop nav — logo, six links, a dropdown, phone number, three theme toggles, and a Get a Quote button — has to fit, and it can't.

I loaded the site at 1000px wide and confirmed it: **"ORION MEDIA" wraps onto two lines and collides with the Services link**, the phone number breaks across three lines as "(518) / 222- / 9845", and both "Tips & Guides" and "Get a Quote" wrap. It looks broken, because it is. This hits landscape tablets, smaller Chromebooks, and anyone on a desktop who doesn't run their browser maximized.

FIX

Move the nav breakpoint from 768px to 1080px so the hamburger takes over before the layout collapses. One-line change in every page's `@media` block.

Your address doesn't match across the web

CRITICAL

1 HR

Your site and your `LocalBusiness` schema both say **Cohoes, NY 12047**. Your BBB profile — which you cite as an A+ trust signal on the homepage — lists you at **10 Colonial Ct, Ballston Lake, NY 12019**, and also references Ballston Spa.

Google cross-references business citations across directories to decide whether it trusts your location. Conflicting NAP (name/address/phone) data is one of the most common and most damaging local-SEO problems, and it directly suppresses map-pack rankings — which is where the majority of "photographer near me" searches convert.

FIX

Pick one canonical address and make it identical everywhere: Google Business Profile, BBB, Facebook, Yelp, and your schema. Same abbreviations, same formatting, character for character.

PERFORMANCE

The site is extraordinarily heavy

Measured by summing the actual content-length of every asset each page requests. Nothing here is an estimate of your design — it's the bytes a visitor's phone has to pull down.

PAGE	ON LOAD	FULL SCROLL	WHAT'S DRIVING IT
portfolio.html	~22 MB	~105 MB	25 YouTube/Matterport iframes with no lazy-loading, plus 188 full-resolution JPEGs
real-estate-photography.html	~4.7 MB	~24.6 MB	5 eager iframes + 59 images averaging 266 KB each
wedding-videography.html	~4.7 MB	~8.9 MB	5 eager iframes + 16 images
about.html	~2.2 MB	~2.2 MB	A single 2 MB PNG headshot at 1132×1132
index.html	~1.2 MB	~1.2 MB	Healthy — one eager iframe is the only weight

25 video embeds load before anyone presses play

CRITICAL2 HRS

Not one of the 47 `<iframe>` elements across your site has `loading="lazy"`. Every YouTube embed pulls roughly 900 KB of player JavaScript the instant the page opens — **on the portfolio page that's ~22 MB before a single frame of video plays.**

On a phone on cellular in a driveway — which is precisely where a Realtor or a couple looks you up — that page may simply never finish loading. Google's Core Web Vitals will read this as a failure, and page-experience signals feed directly into rankings.

FIX

Replace each embed with a lightweight facade: show the YouTube thumbnail as a static image with your own play button, and only inject the real iframe on click. Cuts ~22 MB to under 500 KB and removes the "Watch on YouTube" branding that currently pulls visitors off your site.

Every image is served at full resolution in 2010-era formats

CRITICAL

3-4 HRS

All 381 images on the site are JPEG or PNG — **zero WebP or AVIF**. Portfolio thumbnails are 2000px-wide originals at ~266 KB each, downscaled by the browser to grid tiles. Your logo is a 400×400 PNG at **199 KB**, displayed at roughly 40px, and it loads on all 19 pages. Ryan's headshot is a 2 MB PNG.

No image anywhere carries `width` and `height` attributes either, so the browser can't reserve space and the layout visibly jumps as photos arrive — that's a Cumulative Layout Shift penalty on top of the weight.

FIX

Generate WebP at two sizes (a ~600px thumbnail and a ~1600px lightbox version), serve via `<picture>` with JPEG fallback, and add explicit dimensions to every tag. Convert the logo to SVG. Realistically an 85-90% reduction — the portfolio page drops from ~105 MB to roughly 8 MB.

388 KB of CSS that can never be cached

HIGH

2 HRS

Every page inlines its own `<style>` block — 38 KB on the homepage, 25-37 KB elsewhere — and the site loads **zero external stylesheets**. The shared design system is duplicated 19 times.

Because it's inline, a visitor re-downloads the entire stylesheet on every single page view. Browsing three pages means paying for the same CSS three times, and it inflates every HTML document to 60-100 KB before any content.

FIX

Extract the shared system into `/css/orion.css`, keep only genuinely above-the-fold critical CSS inline, and let the browser cache the rest. Also makes future design changes a one-file edit instead of 19.

SEARCH VISIBILITY

Good bones, leaving rich results on the table

Your structured data is genuinely better than most agency work. Two specific omissions are costing you visible real estate in search results.

You have six real 5★ reviews and no review schema

HIGH

1 HR

There is no `aggregateRating` and no `Review` markup **anywhere on the site** — I checked all 19 pages. Meanwhile you have six genuine, named, detailed Google reviews sitting on your About page.

Adding this markup is what makes ★★★★★ appear under your listing in Google results. Star ratings are consistently one of the largest click-through-rate improvements available in search — and you've already earned the reviews. You're just not declaring them in a format Google can read.

FIX

Add `aggregateRating` to your `LocalBusiness` schema with your real review count and average, plus individual `Review` objects for the six testimonials. Only ever mark up reviews genuinely visible on the page.

21 videos, zero VideoObject markup

HIGH

2 HRS

You embed 21+ YouTube videos and have no `VideoObject` schema on any page. For a videography company, this is the most on-brand rich result available and you're invisible to it.

Video rich results earn a thumbnail directly in the search listing, and can surface in Google's dedicated Videos tab — a second channel your competitors in the Capital Region largely aren't contesting.

FIX

Add `VideoObject` markup per embed with name, description, thumbnail, upload date, and duration. Ship it on the portfolio and wedding videography pages first.

Titles and descriptions get cut off in results

MEDIUM

1 HR

Eight pages have titles between 76 and 91 characters — Google truncates around 60. Every meta description on the site runs 166–251 characters against a ~155 character display limit; your homepage description is 226.

The truncated tail is where your calls to action and location keywords live, so searchers see a clipped sentence ending in an ellipsis instead of a reason to click.

FIX

Rewrite titles to ≤ 60 characters and descriptions to ≤ 155 , front-loading the service and the city. Your blog post titles are the worst offenders.

Your two most important pages are the thinnest

MEDIUM

3 HRS

The homepage carries **540 words** and the portfolio just **294** — while your service pages run a healthy 800–1000. Those are your two highest-authority URLs and they give Google the least to work with.

FIX

Add a substantive "Why Orion" section and an FAQ block with `FAQPage` schema to the homepage (your service pages already do this well). On the portfolio, add real captions — venue names, towns, what the shoot involved. Caption text is indexable and naturally rich in local keywords.

Heading levels skip on eight pages

MEDIUM

45 MIN

Eight pages jump straight from `h1` to `h3`, or `h2` to `h4`, skipping a level. There are also no skip-to-content links anywhere on the site.

Screen readers use heading structure as the primary way to navigate a page, so gaps make the site harder to use with assistive tech — and Google reads that same outline to understand what each page is about.

FIX

Renumber headings so levels descend without gaps, and add a visually-hidden skip link as the first focusable element.

MARKETING & CONVERSION

Where the bookings are leaking

The technical fixes get people to the site. These determine whether they contact you.

Your best sales asset is two clicks from anywhere

CRITICAL

2 HRS

You have six specific, credible, named Google reviews — a Realtor describing a 121-acre, 31-lot shoot; a client praising a sub-24-hour turnaround. They are **the most persuasive content on your entire site**, and they live only at `/about.html#reviews`.

The homepage substitutes abstract stats — "A+ BBB", "500+ Projects", "5★ Google Reviews". Numbers assert quality; a named person describing what you actually did for them proves it. Right now a visitor can go hero → services → contact form and never see a single client word.

FIX

Put two or three reviews on the homepage above the contact form, and place the most relevant one on each service page — the Realtor review on real estate, the July-wedding drone review on weddings. Also worth noting: your newest review is roughly two years old. Ask your last five clients for a Google review this month.

You're absent from where couples actually shop

CRITICAL

ONGOING

I searched "wedding videographer Albany NY Capital Region." The entire first page is directories — WeddingWire, The Knot, Zola, Thumbtack, Yelp, Eventective. Orion appears on none of them.

This matters more than any on-page tweak: for weddings, **the directories own the search results and you cannot outrank them with your own domain**. Couples don't browse ten vendor websites — they open The Knot, filter by budget and date, and shortlist from there. Your beautiful site never enters the consideration set.

Encouragingly, the same search for real estate photography puts your `real-estate-photography.html` page on page one organically — that channel is working. Weddings are the gap.

FIX

Create listings on The Knot, WeddingWire, and Zola, with full galleries and your real pricing. Then migrate your Google reviews' momentum there — directory reviews are what drive placement within those platforms.

A visual company using icons where photos belong

HIGH

2 HRS

All six homepage service cards use small line-art icons — a camera outline, a cube, a play triangle. Below a hero that promises cinematic work, the first proof point a visitor reaches is generic clip art. You have 188 photographs sitting on the portfolio page. The single strongest frame from each category belongs on its service card. For a studio selling visual quality, showing the work *is* the argument.

FIX

Swap each icon for your best image from that category, with the service name overlaid. Same layout, dramatically different impression — and it makes the homepage's thin word count less of a problem by giving people something to look at.

No proof above the fold

HIGH

30 MIN

The hero gives a headline, a subhead, and two buttons. A first-time visitor who has never heard of Orion has **no reason yet to believe the "premier" claim**, and the trust signals don't appear until several screens down.

FIX

Add one compact line under the CTAs: ★★★★★ · 5.0 on Google · A+ BBB · FAA Part 107 Certified. Small, quiet, and it changes the read of everything above it.

One-shot funnel — you capture buyers, not browsers

MEDIUM

3 HRS

Every conversion path on the site ends at the same quote form. Someone twelve months out from a wedding, or an agent who isn't listing anything this week, has no way to stay in touch — they leave and you never hear from them.

FIX

Add one low-commitment offer: a "Capital Region Wedding Venue Guide" PDF (you've already written the blog post) or a "Listing Photo Prep Checklist" for agents, in exchange for an email. Formsprees already handles the capture. It turns your blog traffic into a list you can market to.

YouTube branding is pulling visitors off your site

MEDIUM

INCLUDED ABOVE

Your embeds show the standard YouTube chrome — a red play button, a share icon, and a "Watch on YouTube" link. Every one of those is an exit route away from your booking form, placed on top of your best work.

FIX

The lazy-load facade recommended in the performance section solves this too: your own thumbnail, your own violet play button, video plays inline. One change, two wins.

What you should not change

Several things here are done better than most professionally built small-business sites. Worth protecting during any rebuild.

Package-aware contact links

Your pricing buttons pre-fill the contact form with the exact package and price. That's a genuinely sophisticated conversion detail most agencies skip.

Sticky call / text bar on mobile

Persistent Call and Text buttons with GA4 events wired to each. Exactly right for a business people hire from their phone.

Transparent pricing everywhere

Real numbers on every service page. This pre-qualifies leads and is a real competitive advantage in a market that hides behind "contact for quote."

Conversion tracking already live

`generate_lead`, `phone_call`, `email_click`, and `sms_click` events all firing to GA4. Most small sites never get this far.

Genuinely rich schema

Full LocalBusiness with geo coordinates, opening hours, service catalog, and areas served — plus FAQPage on every service page.

Clean hosting and redirects

HTTP→HTTPS and www→apex both return proper 301s. Static hosting on GitHub Pages means fast TTFB and no CMS to maintain.

Mobile layout is solid

At 390px the site is clean, readable, and well-spaced. The responsive problem is confined to the tablet range.

Six real blog posts

Locally-focused, 730–940 words each, properly marked up as Articles. A real content foundation to build on.

What to do, in order

Sequenced by return on effort. Phases 1 and 2 are roughly a weekend and capture most of the available gain.

01 Stop the bleeding

~2 HOURS · DO IT FIRST

- Export and upload a real `og-image.jpg`, then re-scrape on Facebook
 - Move the nav breakpoint from 768px to 1080px
 - Remove the Saratoga 404 from the sitemap and the three blog links pointing at it
 - Align your address across BBB, Google Business, and Facebook to match the site
-

02 Make it fast

~1 DAY · BIGGEST SINGLE WIN

- Convert all images to WebP at two sizes, with explicit width/height attributes
 - Replace the 199 KB PNG logo with an SVG, and compress the 2 MB headshot
 - Swap all 47 iframes for click-to-load facades
 - Extract the shared CSS into one cacheable external stylesheet
-

03 Convert more of the traffic you already have

~1 DAY

- Move reviews onto the homepage and matching service pages
- Add the trust line under the hero CTAs
- Replace service-card icons with your actual photography
- Add `aggregateRating` and `Review` schema for star results
- Request Google reviews from your five most recent clients

04

Expand the surface area

ONGOING

- Build the Saratoga Springs page properly, then Albany, Troy, Clifton Park, Schenectady
- Create The Knot, WeddingWire, and Zola listings
- Add `VideoObject` schema across all embeds
- Rewrite titles and meta descriptions to fit within display limits
- Launch one lead magnet with email capture
- Add portfolio captions naming venues and towns

Audit performed 31 August 2026 against the live site. All 19 sitemap URLs crawled; asset weights measured from HTTP content-length; layout defects reproduced in-browser at 390px, 900px, 1000px, and 1440px.
